

PATIENT INFORMATION

CARBOHYDRATE COUNTING REFERENCE TABLES

The enclosed tables list the carbohydrate content of usual foods. You can use these to calculate the carbohydrate content of meals and snacks you eat. You can then alter your insulin doses accordingly.

The list shows the amount (grams) of carbohydrate in a typical serving although this can vary depending on your portion size. Compare this with your serving and multiply or divide the value accordingly.

It also includes the average carbohydrate value per 100g (Reference Value). You can use this information when calculating the carbohydrate value of a weighed food portion e.g. cooked rice.

Example:

Cooked rice has 30g carbohydrate per 100g

$30 \div 100 = 0.3$ (this is the amount of carbohydrate in 1g)

Weigh your portion e.g. 200g

$0.3 \times 200\text{g} = 60\text{g}$ of carbohydrate in your portion

A selection of brand foods is also shown. Values can differ between products.

More information is available from food labels, remember this should be the **TOTAL** carbohydrate content including both starches and sugars.

Note: On the table headings CHO = Carbohydrates
