NHS South Worcestershire Clinical Commissioning Group

NHS Wyre Forest Clinical Commissioning Group

# Tonsillectomy (Adults and Children)

## June 2017

**This policy applies to patients for whom the following Clinical Commissioning Groups are responsible:**

- NHS South Worcestershire Clinical Commissioning Group (CCG)
- NHS Redditch & Bromsgrove Clinical Commissioning Group (CCG)
- NHS Wyre Forest Clinical Commissioning Group (CCG)

*Collectively referred to as the Worcestershire CCGs*

**COMMISSIONING SUMMARY**

Worcestershire CCGs (also termed "the Commissioner" in this document) will only fund Tonsillectomy in adults and children if the following eligibility criteria are met:

- seven or more well documented, clinically significant,* adequately treated** sore throats in the preceding year

or

- five or more such episodes in each of the preceding two years

Specified indications for immediate referral (eg. malignancy, upper airways obstruction) are also commissioned and further detail is provided in section 6 of this document.

* A clinically significant episode is determined as symptom duration of several days, which is disabling and prevents normal functioning[1] (e.g. school or work loss, lost sleep and inability to eat).

** Adequately treated means treatment with antibiotics in cases of proven or suspected streptococcal infection.

| Elective Care Clinical Review Group | Various in line with meeting schedule and workstream | V2.2 |
| | | |

## Version Control:

| Version No | Type of Change | Date | Description of change |
|---|---|---|---|
| 1.0 | Initial Document | June 2010 | Initial policy document produced |
| 2.1 | Minor change | April 2013 | Reformatted to reflect changes of responsible commissioner organisations within Worcestershire |
| 2.2 | Minor Change | May 2017 | Reformatted to use updated template. Verification that clinical change to content of policy unnecessary |
| | | | |
| | | | |

## Table of Contents

# 1. Definitions

1.1 The term 'sore throat' describes the symptom of pain at the back of the mouth. Clinical descriptions of acute sore throat include:

- Acute **pharyngitis**: inflammation of the part of the throat behind the soft palate (oropharynx).
- **Tonsillitis**: inflammation of the tonsils.

1.2 **Exceptional clinical circumstances** are clinical circumstances pertaining to a particular patient, which can properly be described as exceptional, when compared to the clinical circumstances of other patients with the same clinical condition and at the same stage of development of that condition (i.e. similar patients). A patient with **exceptional clinical circumstances** will have clinical features or characteristics which differentiate that patient from other patients in that cohort and result in that patient being likely to obtain significantly greater clinical benefit (than those other patients) from the intervention for which funding is sought.

1.3 A **Similar Patient** is a patient who is likely to be in the same or similar clinical circumstances as the requesting patient and who could reasonably be expected to benefit from the requested treatment to the same or a similar degree. The existence of more than one similar patients indicates that a decision regarding the commissioning of a **service development** or commissioning policy is required of the Commissioner.

1.4 An **individual funding request (IFR)** is a request received from a provider or a patient with explicit support from a clinician, which seeks exceptional funding for a single identified patient for a specific treatment.

1.5 An **in-year service development** is any aspect of healthcare, other than one which is the subject of a successful individual funding request, which the Commissioner agrees to fund outside of the annual commissioning round. Such unplanned investment decisions should only be made in exceptional circumstances because, unless they can be funded through disinvestment, they will have to be funded as a result of either delaying or aborting other planned developments.

# 2. Scope of policy

2.1 This policy is part of a suite of locally endorsed Commissioning Policies. Copies of these Commissioning Policies are available on the following website address: http://www.redditchandbromsgroveccg.nhs.uk/about-us/strategies-policies-and-procedures/commissioning-ifr/

2.2 This policy applies to all patients for whom the Worcestershire CCGs have responsibility including:

- People provided with primary medical services by GP practices which are members of any one of the CCGs and
- People usually resident in any of the areas covered by the CCG's and not provided with primary medical services by any CCG.

2.3 This policy covers patients presenting with recurrent tonsillitis in whom a tonsillectomy procedure, which has an OPCS code of F34, may be considered clinically appropriate.

2.4 Where a patient's clinical presentation does not clearly meet the requirements for secondary care referral within the context of this policy, and where a GP is uncertain or concerned about the appropriate treatment/management pathway, referral for Advice & Guidance should be considered as an alternative to a referral for clinical assessment.

2.5 There may be occasions when a GP referral is made for specialist assessment which appears to meet the policy requirements, but which on specialist clinical examination either does not meet the clinical criteria for surgery or is not considered clinically suitable for surgery. Such patients should be discharged without surgery.

2.6 For patients who do not fall within the eligibility criteria set out in the policy but where there is demonstrable evidence that the patient has exceptional clinical circumstances, an Individual Funding Request may be submitted for consideration. The referring clinician should consult the Commissioner's "Operational Policy for Individual Funding Requests" document for further guidance on this process.

For a definition of the term "exceptional clinical circumstances", please refer to the Definitions section of this document.

## 3. Background

3.1. The NHS Constitution, which details the principles and values that guide the NHS, has been applied in the agreement of this policy.

3.2. NHS Redditch & Bromsgrove Clinical Commissioning Group, NHS South Worcestershire Clinical Commissioning Group and NHS Wyre Forest Clinical Commissioning Group consider all lives of all patients whom they serve to be of equal value and, in making decisions about funding treatment for patients, will seek not to discriminate on the grounds of sex, age, sexual orientation, ethnicity, educational level, employment, marital status, religion or disability except where a difference in the treatment options made available to patients is directly related a particular patient's clinical condition or is related to the anticipated benefits to be derived from a proposed form of treatment.

3.3. Surgical removal of the tonsils (tonsillectomy) is one of the commonest major operations carried out on children. Increasingly, it is performed on adults who in the past would almost certainly have had their tonsils removed in childhood as a matter of routine. However, the procedure is a controversial one, and opinions vary greatly as to the relative risks and benefits. The risks of surgery include those of the associated general anaesthetic and those specific to the procedure, for example bleeding immediately after surgery or as a result of secondary infection in the 10 to 14-day period after surgery.

3.4. Tonsillectomy can prevent recurrent acute attacks of tonsillitis, but not recurrent sore throats due to other causes. Before considering tonsillectomy, the diagnosis of recurrent tonsillitis should be confirmed by history and clinical examination and, if possible, differentiated from generalised pharyngitis.

3.5. The natural history of tonsillitis is for the episodes to get less frequent with time, but epidemiological data are lacking in all age groups to allow a prediction of this to be made in individual patients.

3.6. Tonsillectomy requires a short admission to hospital and a general anaesthetic, is painful, and is occasionally complicated by bleeding. Return to usual activities takes on average two weeks, with a corresponding loss of time from education or work.

3.7. Evidence on exactly which children with sore throats benefit from tonsillectomy is not available, but current evidence suggests that the benefit of tonsillectomy increases with the severity and frequency of sore throats prior to tonsillectomy. Apart from adults with proven recurrent group A streptococcal pharyngitis (GAHSP), evidence on which adults will benefit from tonsillectomy is not available.

## 4. Relevant National Guidance and Facts

4.1 Recurrent acute sore throat is a very common condition presenting in primary care and tonsillectomy is one of the most common operations. It presents a significant burden of disease; in the period quarter 1 to quarter 4 2014/15 10,155 tonsillectomies were carried out for recurrent tonsillitis in children (less than 17 years) and 2,228 in adults in England.

4.2 The following national guidance is available. Whilst only the Scottish Intercollegiate guidance (SIGN) was available at the time of the original policy development, the joint Royal College of Surgeons and ENT-UK Commissioning Guide refers to the SIGN recommendations as does NICE Clinical Knowledge Summaries. In view of this it was considered unnecessary to change the clinical eligibility criteria for accessing tonsillectomy detailed in section 6.

- Scottish Intercollegiate Guidelines Network (SIGN): Management of sore throat and indications for tonsillectomy Clinical Guideline 117; April 2010
- NICE Clinical Knowledge Summaries. Last Revised July 2015
- Royal College of Surgeons and ENT-UK Commissioning Guide: Tonsillectomy. 2016

## 5. Patient Eligibility

5.1 Tonsillectomy is <u>automatically</u> recommended when :

- There is suspicion of malignancy, typically squamous carcinoma or lymphoma;
- Severe tonsillitis or peritonsillar abscess (quinsy) resulting in hospitalisation;
- Tonsillar enlargement causes upper airways obstruction or sleep disruption in children witnessed by their parents or carers.

5.2 The following criteria are indications for consideration of tonsillectomy for both children and adults:

- seven or more well documented, clinically significant,* adequately treated** sore throats in the preceding year

or

- five or more such episodes in each of the preceding two years

A clinically significant episode is determined as symptom duration of several days, which is disabling and prevents normal functioning[i] (e.g. school or work loss, lost sleep and inability to eat).

** Adequately treated means treatment with antibiotics in cases of proven or suspected streptococcal infection.

5.3 In considering whether a patient meets these criteria, there may be difficulty in documenting the frequency of episodes because patients do not always consult

when they have an episode. There may also be uncertainty about whether the sore throats are due to acute tonsillitis or other causes.

5.4 When the incidence of cases cannot be clearly ascertained, a period of watchful waiting of at least six months, during which the patient or parent can more objectively record the number, duration and severity of the episodes, should be undertaken. This allows a more balanced judgement to be made as to the likely benefit or otherwise of tonsillectomy. This should be reported back to the GP after six months, to enable an appropriate referral decision to be made.

5.5 **When outside the three automatic referral criteria, a clear statement is required in the GP referral proforma indicating that the patient meets the eligibility criteria for surgery. This should reference the number of episodes of tonsillitis over a specified time period, or that a six month period of watchful waiting has been undertaken. The basis for any referrals made outside these criteria should be made clear in the referral proforma.**

5.6 **There may be occasions when a GP referral is made for specialist ENT assessment which appears to meet the policy requirements, but which on specialist clinical examination either does not meet the clinical criteria for surgery or is not considered clinically suitable for surgery. Such patients should be discharged without surgery.**
